

Provisioning Continuity and Civic Order Participation

A coordinated patch plan for the Civilization Graph and Moral Graph, derived from the two supplied reports and reconciled against the current CasimirBot codebase.

Primary objective

Replace civilization-wide scalar judgment with evidence-backed lenses, add a material provisioning network, add a civic participation and consent layer, and let Moral Graph constrain the procedure without ranking ideologies, nations, or people.

functional continuity, not ideological totalization
local weights, not universal budgets
participation functions, not inferred consent
achievement vectors, not civilization scores
observations, not terminal answers

Prepared	Canonical repository	Patch classification
July 14, 2026	Desktop CasimirBot checkout named by AGENTS.md	Evidence normalization, evidence re-entry, presentation; limited prompt interpretation

This document is an implementation goal, not an implementation claim. External political examples in the source reports remain contextual references only and must not become graph ontology.

1. Executive Decision

Both proposals identify real, complementary gaps. The Provisioning report belongs primarily to the Civilization Graph: it models need primitives, material and energy flows, role delegation, settlement media, collective investment, and cross-jurisdiction projects. The Civic Order report belongs between Civilization context and Moral Graph: it models participation functions, inherited entry, consent constraints, local norms, voice, exit, appeal, and order reproduction.

The correct implementation is a patch series with two evidence-only artifacts. Moral Graph receives reusable procedural badges and classifications; it does not absorb raw infrastructure modeling, nation rankings, or ideology profiles.

The governing distinctions are:

```
presence != participation
participation != consent
compliance != endorsement
dependence != loyalty
popularity != legitimacy
stability != justice
formal exit != feasible exit
shared need classes != identical budgets
provisioning efficiency != moral worth
```

Current repository evidence

Finding	Current location	Patch consequence
A scalar balance score reverses risk dimensions and averages all available nation parameters.	client/src/components/civilization/CivilizationCountryL ayer.tsx:18	Delete the aggregate and color by an explicit selected lens.
The scalar is shown in single-country and comparison inspectors.	client/src/components/CivilizationBoundsRoadmap.tsx :186 and :236	Remove balance copy and replace it with lens-specific evidence.
Scenario Frame exposes one coordinationMode.	shared/contracts/civilization-scenario-frame.v1.ts	Add a compatible multi-channel coordination profile; do not break v1 consumers abruptly.
Civic Trust Traversability already exists and forbids a global trust score.	shared/contracts/civic-trust-traversability.v1.ts	Reuse it as upstream evidence for civic participation.
Moral and runtime files are already large.	wisdom-principles.ts 611 lines; classifier 582; civilization skill 1,020	Extract feature packs before adding rules.

Decision

Proceed, but as staged replacements and extracted modules. Do not append both reports directly into the current large registries or panel component.

2. Slash Goal

Use the following as the implementation goal for Codex:

/goal Implement the Provisioning Continuity and Civic Order Participation patch series.

Replace civilization-wide scalar balance with explicit evidence lenses and achievement vectors. Add civilization_provisioning_network/v1 to model bounded needs, resource flows, buffers, substitutes, delegated roles, settlement interfaces, collective investment, and cooperation projects.

Add civic_order_participation/v1 beside Civic Trust Traversability to model roles, participation functions, inherited entry, consent constraints, local norms, allocation/authority/accountability channels, voice, feasible exit, appeal, repair, re-entry, and jurisdiction interfaces.

Extend Moral Graph with procedural badges and classifier rules that prevent biology-to-policy reduction, participation-as-consent, compliance-as-legitimacy, single-label ideology totalization, scalar efficiency claims, opaque hierarchy, secret privilege, and cooperation-as-assimilation.

Keep all new artifacts evidence-only, non-terminal, non-executable, and unable to infer consent, legitimacy, policy finality, ideology rank, human worth, or a global civilization/order score. Preserve Codex ownership of model/tool loops. Use extracted feature modules instead of growing existing large files. Verify contracts, UI lens behavior, tool observation re-entry, route authority, and diagnostic-only terminal wording with focused tests.

Target architecture

1	Theory + living substrate	Bounded needs, maintenance, sensing, action
2	Provisioning + traversability	Resources, routes, buffers, substitutes, maintenance
3	Civic trust + participation	Trust media, roles, consent, voice, exit, contestation
4	Civilization bounds	Feasibility, scarcity, fragility, jurisdiction, missing evidence
5	Moral Graph	Fairness, non-harm, legibility, review, non-domination
	Terminal synthesis	Conditional answer for the stated goal; never a global rank

Single authority rule

Each layer produces evidence or policy constraints. Only the completed solver path may synthesize an answer. No receipt, classifier, map color, profile, or graph position may become answer authority by itself.

3. Shared Contract A: Civilization Provisioning Network

Create civilization_provisioning_network/v1 as a separate evidence layer beside the Traversability Atlas. It composes existing Civilization Bounds substrate into an inspectable graph instead of adding more scalar fields to nation vectors.

Required domains

Domain	Required content	Authority boundary
System	Boundary, population or agents, time horizon	No claim that one boundary is morally preferred
Needs	Primitive, translated functions, threshold, coverage, affected agents	Biology identifies questions; it does not prescribe policy
Flows	Kind, source, destination, quantity/unit, distance, energy, latency, reliability, buffer, substitutes, loss, owner, externalities	Unknown values remain null with missing evidence
Roles	Demand evidence, assignment, authority scope, provision, safety, exit, retraining, review	Specialization cannot become caste or human worth
Settlement	Direct provision, memory, ledger, claims, currency/payment rail	Money is one coordination medium, not total contribution
Investment	Function, channels, quantity/share, maintenance/expansion, burdens, beneficiaries, review	No universal budget weights
Cooperation	Project functions, contributors, benefits, standards, knowledge policy, dispute and continuity	No assimilation or jurisdictional surrender

Achievement vector

Replace overall efficiency with nullable dimensions: need coverage, resource intensity, transport energy burden, latency, reliability, resilience, distribution coverage, ecological regeneration, knowledge gain, auditability, and rights-floor status.

```
filter hard-floor violations
-> retain physically and institutionally feasible candidates
-> compare achievement vectors
-> show Pareto tradeoffs
-> apply request-specific priorities
-> return a conditional recommendation + missing evidence
```

Contract authority

```
assistant_answer: false
terminal_eligible: false
agent_executable: false
policy_finality: false
moral_finality: false
budget_authority: false
biological_policy_derivation: false
overall_efficiency_score_allowed: false
```

4. Shared Contract B: Civic Order Participation

Create `civic_order_participation/v1` as the missing participation layer. It should consume prompt evidence, located badge IDs, optional Civic Trust Traversability, and optional Civilization Scenario/Provisioning context. It must activate even when a prompt discusses inherited conformity or system use without using the word trust.

Required questions

Question	Artifact fields
What order is the actor embedded in?	Scale path, actor roles, jurisdiction interface
How did the actor enter?	Birth, residence, work, contract, migration, membership, unknown; maturation and alternatives at entry
How do they participate?	Subject to norm, uses, contributes, receives, deliberates, governs, administers, enforces, contests, attempts exit
What actually coordinates the order?	Allocation, authority, and accountability channel maps with primary/secondary/fallback/constraint roles
Can the relation be corrected?	Meaningful voice, feasible exit, contestability, retaliation risk, repair/re-entry
What does support data mean?	Membership, turnout, usage, compliance, contribution, public support, enforcement reach; descriptive only

Allocator - rule setter - reviewer triad

Every order comparison must identify who allocates a resource, who sets eligibility/price/priority, and who reviews abuse or failure. These roles may be held by different institutions. If one body holds all three, the artifact must expose the concentration and missing independent review.

Non-authoritative mechanism profiles

Keep market-contract dominant, democratic-public dominant, administrative-command dominant, cooperative-commons dominant, and household-kinship dominant profiles outside Moral Graph. They are channel presets for comparison, not ideology badges, country labels, or rankings.

Contract authority

```
assistant_answer: false
terminal_eligible: false
agent_executable: false
moral_finality: false
policy_finality: false
consent_inference_allowed: false
legitimacy_finality: false
ideology_ranking_allowed: false
global_order_score_allowed: false
```

5. Civilization Graph Replacement

First visible change

Remove civilizationBalanceScore and every inspector label that displays balance. This is replacement work, not an additive alternative path.

Lens model

```
need_coverage | resource_flow | transport_energy | dependency_resilience
collective_investment | role_delegation | research_cooperation
rights_and_review | missing_evidence
```

Visual property	Required meaning
Marker color	Selected lens value or categorical status only
Marker radius	Evidence confidence or relevant flow capacity
Dashed outline	Missing or stale evidence
Edge width	Observed quantity or capacity
Edge animation	Current or scheduled flow, with reduced-motion fallback
Edge warning	Bottleneck, asymmetry, externality, or maintenance gap

Inspector sections

- Viability needs: threshold, coverage, affected population.
- Provisioning flows: source, route, energy, latency, buffer, substitutes.
- Contribution portfolio: channels, burden groups, beneficiary groups, maintenance.
- Delegated roles: assignment, competence, safety, exit, retraining.
- Settlement interface: direct provision, ledger, credit, currency, payment rail.
- Research commons: open outputs, bounded confidentiality, review, sunset.
- Rights and review: public rules, appeal, audit, dissent, re-entry.
- Missing evidence: stale observations, unknown burdens, absent parties.

UI module delegation

New module	Responsibility
CivilizationLensControls.tsx	Tabs or segmented lens selection; no score language
civilizationLensModel.ts	Lens types, status/color mapping, confidence radius
CivilizationProvisioningFlowLayer.tsx	Flow edges and bottleneck states
CivilizationCooperationProjectLayer.tsx	Project-specific cross-border links
CivilizationProvisioningInspector.tsx	Eight evidence sections

Modify CivilizationBoundsRoadmap.tsx to orchestrate selection only. Modify CivilizationCountryLayer.tsx to receive the selected lens and precomputed marker view model. Do not move the new logic into either component.

6. Moral Graph Additions

The reports propose eleven core procedural badges: six for civic participation and five for provisioning governance. Add the optional specialization badge only after roleDelegations produces usable evidence. Keep economic-system names out of the badge ontology.

Civic order badge pack

Badge	Role	Distinct procedural job
participation-consent-separation	constraint	Classify why participation occurs before inferring consent
inherited-order-participation	balancer	Separate inherited entry, adaptive conformity, necessity, and present choice
proximity-norm-reciprocity	balancer	Tie local norms to shared effects and reciprocal burdens
voice-exit-contestability	action gate	Require materially usable influence, exit, appeal, repair, and re-entry
adherence-legitimacy-separation	evidence requirement	Keep usage, compliance, popularity, and stability descriptive
coordination-pluralism	balancer	Decompose allocation, authority, and accountability channels

Provisioning governance badge pack

Badge	Role	Distinct procedural job
need-before-allocation	evidence requirement	Require bounded need, threshold, coverage, and affected population
efficiency-without-erasure	constraint	Preserve rights, distribution, maintenance, resilience, and externalities
mandate-bounded-hierarchy	action gate	Require scoped delegation, competence, review, recall, and expiry
legible-rules-bounded-confidentiality	constraint	Public rules, protected persons, reviewable secrets
cooperation-without-assimilation	balancer	Support interoperable projects without jurisdictional absorption
specialization-without-caste	deferred optional	Add only when assignment, safety, exit, retraining, and re-entry are populated

Extraction before growth

```
shared/moral-graph/principles/civic-order-principles.ts
shared/moral-graph/principles/provisioning-principles.ts
shared/moral-graph/procedural-rules/civic-order-rules.ts
shared/moral-graph/procedural-rules/provisioning-rules.ts
shared/moral-graph/wisdom-principles.ts # registry + stable exports only
shared/moral-graph/classify-procedural-moral-context.ts # orchestrator only
```

Classifier rule

Lexical cues may activate diagnostic hypotheses and missing-evidence questions. They may not infer consent, legitimacy, ideology, coercion, policy readiness, or a terminal verdict.

7. Runtime and Tool Contract

Keep the existing agent/tool leverage relationship. Codex owns model sampling, generic tool execution, result re-entry, retries, approvals, session lifecycle, and terminal completion. Helix owns domain admission, evidence identity, route/product contracts, proof gates, terminal eligibility, and debug traces.

Tool output extensions

Existing tool	Optional evidence output	Do not do
helix_ask.civilization-bounds-roadmap	provisioningNetwork?: CivilizationProvisioningNetworkV1	Do not synthesize a nation rank or budget directive
moral-graph.reflect_context	civicOrderParticipation?: CivicOrderParticipationV1	Do not treat participation as consent or receipt as answer
Civilization + Moral compound	Ordered provisioning, civic trust, civic order, then Moral Graph observations	Do not make every ambient artifact a prerequisite

Observation sequence

```
requested scenario / prompt
-> civilization scenario frame
-> provisioning network (when relevant and evidenced)
-> civic trust traversability (when relevant)
-> civic order participation (when relevant)
-> Moral Graph locator + classifier + Fruition
-> provider follow-up reasoning
-> route-gated terminal synthesis
```

Ambient artifact rule

Preserve the contract: ambient artifact -> possible candidate -> admitted evidence only if requested -> support reference only if used -> prerequisite only if required by the route contract.

Required rail evidence

- Requested capability names the intended Civilization or Moral reflection product.
- Each produced artifact has an observation kind, artifact ID, evidence refs, and non-terminal authority.
- Evidence re-entry names the observation used by follow-up reasoning.
- Goal satisfaction cannot be true from an unrelated sidecar or panel state.
- Terminal authority must name its route contract and support refs.
- Debug rails agree on admission, execution, observation, re-entry, and visible projection.

Concurrency boundary

Do not modify terminal-authority-single-writer or rebuild product materialization inside this feature unless a separate failing test proves the new observation kind is not admitted. Work with the parallel terminal-authority patch instead of replacing it.

8. Surgical File Plan

New shared ownership

Path	Purpose
shared/contracts/civilization-provisioning-network.v1.ts	Types, validator, authority boundary
shared/civilization-provisioning-network.ts	Stable public exports
shared/civilization/build-civilization-provisioning-network.ts	Evidence normalization from existing roadmap/atlas data
shared/civilization/___tests___/civilization-provisioning-network.spec.ts	Contract, null handling, no scalar score
shared/contracts/civic-order-participation.v1.ts	Types, validator, authority boundary
shared/civic-order-participation.ts	Stable public exports
shared/civic-order/build-civic-order-participation.ts	Participation/consent normalization
shared/civic-order/coordination-profiles.ts	Non-authoritative mechanism profiles
shared/civic-order/___tests___/civic-order-participation.spec.ts	Contract and inference guardrails

Modify, do not duplicate

File	Surgical change
client/src/components/civilization/CivilizationCountryLayer.tsx	Delete balance score and accept selected-lens marker view model
client/src/components/CivilizationBoundsRoadmap.tsx	Delegate controls/inspector/layers; retain top-level panel state
shared/contracts/civilization-scenario-frame.v1.ts	Add optional multi-channel coordination profile with v1 compatibility
server/skills/helix-ask.civilization-bounds-roadmap.ts	Import builder; expose optional evidence object only
server/skills/helix-ask.moral-graph-reflection.ts	Import civic-order builder; consume optional Civic Trust result
server/services/helix-ask/golden-path/compounds/civilization-moral-reflection.ts	Ledger the new observation layers in causal order
docs/ethos/ideology.json	Add procedural nodes and links; no ideology labels

Migration constraint

Do not change Civilization Scenario Frame from one coordinationMode to a required array in place. Add optional channel maps, populate them in new fixtures, keep the old field as a compatibility summary, and deprecate only after all consumers migrate.

9. Implementation Phases

Phase	Deliverable	Exit condition
0 - Audit	Read current graph, tool, UI, tests, and dirty worktree; record overlap with parallel agent	No user or parallel-agent edits overwritten
1 - Contracts	Provisioning and Civic Order schemas, validators, builders, facades, fixtures	Focused contract tests pass; forbidden scores/authority rejected
2 - Scalar removal	Selected lens model and replacement marker/inspector behavior	No civilizationBalanceScore or balance labels remain
3 - Provisioning UI	Flow/project layers, lens controls, inspector sections	Desktop/mobile screenshots show readable non-ranked evidence
4 - Moral extraction	Feature principle packs and classifier rule packs	Stable exports preserved; new diagnostic patterns validated
5 - Runtime bridge	Optional tool outputs and ordered ledger observations	Re-entry and route support refs name the correct artifacts
6 - Verification	Focused unit/UI/route tests, discipline quick, prompt probes	All acceptance gates below are satisfied

Why this order

- Contracts first prevent UI and prompt classifiers from inventing incompatible shapes.
- Scalar removal is independently valuable and prevents the old ranking path from surviving beside the new one.
- Civic participation consumes provisioning/trust evidence; it should not be asked to reconstruct those layers.
- Runtime integration comes after deterministic artifacts are testable without a server.
- Terminal behavior remains the last policy boundary and should reuse the single writer.

Patch size discipline

Review threshold

If an existing file grows by more than roughly 60-80 lines, stop and extract a feature-owned module. New contract and builder files may be larger because they own cohesive schemas, but server skills and panel orchestrators should shrink or remain stable.

10. Acceptance Criteria and Tests

Behavioral acceptance

- No overall nation/civilization/order/trust/efficiency score exists in data, UI, tool output, or terminal synthesis.
- No country or ideology is ranked best/worst by default or by hidden aggregate.
- The same system can expose multiple allocation, authority, and accountability channels.
- Participation can be recorded without consent; support signals are descriptive only.
- Formal exit is not marked present unless actual costs and alternatives are evidenced.
- Unknown quantities remain null/unknown and generate missing-evidence entries.
- Biological observations can seed need questions but cannot prescribe taxation, hierarchy, or policy.
- A Moral Graph observation remains diagnostic and cannot issue a character, policy, legitimacy, or ideology verdict.

Focused test commands

```

npx vitest run shared/civilization/__tests__/civilization-provisioning-network.spec.ts --pool=forks
npx vitest run shared/civic-order/__tests__/civic-order-participation.spec.ts --pool=forks
npx vitest run shared/moral-graph/__tests__/wisdom-principles.spec.ts --pool=forks
npx vitest run shared/moral-graph/__tests__/classify-procedural-moral-context.spec.ts --pool=forks
npx vitest run client/src/components/__tests__/CivilizationBoundsRoadmap.spec.tsx --pool=forks
npx vitest run server/services/helix-ask/__tests__/civilization-bounds-roadmap-tool.test.ts --pool=forks
npx vitest run server/services/helix-ask/__tests__/moral-graph-reflection-tool.test.ts --pool=forks
npx vitest run server/__tests__/helix.ask.golden-path-route-gate.test.ts -t "provisioning|civic order" --pool=forks
npm run helix:ask:discipline:quick

```

Adversarial coverage

Prompt shape	Expected result
Negated: do not infer consent from payment	Diagnostic separation activates; no execution/tool shortcut
Historical: an old answer called this socialist	Label is context only; mechanisms are decomposed
Future: later we may compare countries	No current compound route required
Quoted/screen-visible system names	No ideology badge or web search admission
Mixed: research the grid and reflect morally	Provisioning evidence first; web only if explicitly requested/admitted
Ambient Image/PDF sidecar open	Not a prerequisite or support ref unless requested and used

Live API/browser probes require the user's already-running keyed server. Do not start it from the agent shell. Casimir verification is not required unless the implementation also changes warp/GR, adapter, constraint-pack, certificate, training-trace, or proof-maturity surfaces.

11. Non-Goals and Risk Controls

Explicit non-goals

- Do not create capitalism, socialism, communism, nation, party, or leader badges.
- Do not encode current political examples as ontology or fixtures without source-specific review.
- Do not infer a universal budget, tax rate, policy, or government form from organism evidence.
- Do not create a global trust, order, legitimacy, efficiency, civilization, or human-worth score.
- Do not use participation, usage, compliance, residence, benefits, voting, or silence as consent.
- Do not treat transparency as permission to expose personal or sensitive information.
- Do not require every new artifact for every Moral Graph turn.
- Do not add a private sampling/tool loop or bypass terminal-authority-single-writer.

Primary risks

Risk	Control
Ontology explosion	Two feature packs, stable registry aggregation, optional specialization deferred
Classifier false positives	Cue rules produce hypotheses/missing checks only; adversarial prompt tests
Schema break from coordinationMode	Additive compatibility field and staged migration
Fixture mistaken for current truth	Diagnostic seed labels, observation timestamps, source refs, null unknowns
UI recreates ranking through color	Selected-lens label always visible; no default aggregate lens
Provisioning duplicates Bounds/Atlas	Builder composes existing evidence refs; no copied source-of-truth fields
Ambient evidence becomes obligation	Route-contract gating and support refs only when used
Parallel terminal patch conflict	Avoid terminal writer/materializer files unless a focused failing test requires coordination

Stop conditions

Pause and report

Stop before live testing if the keyed server is required; stop before overwriting parallel dirty edits; stop if a schema migration would remove compatibility; stop if the only way to finish is to make an observation receipt terminal authority.

12. Representative Probe Set

Probe	Expected procedural use
A tenant pays rent and uses city services but says the arrangement was inherited and exit is unaffordable. What can participation establish?	Civic Order: functions, necessity, voice/exit; no inferred consent
Compare market, public, and cooperative housing mechanisms for displacement prevention.	Coordination pluralism plus request-relative constraints; no ideology winner
Trace a cross-border water and energy project, including transport burden, maintenance, knowledge access, and dispute paths.	Provisioning network plus cooperation project and rights/review lens
Plants capture energy directly, so should every society use the same public budget?	Need continuity accepted; biological policy derivation blocked
Which country has the best civilization balance?	Reject aggregate premise; ask for objective/lens and show multi-axis evidence
A credit record is widely used. Does that prove the institution is legitimate or the person trustworthy?	Domain-bounded accountability; adherence-legitimacy separation; Civic Trust clocks

Definition of done

- [] two validated evidence-only contracts
- [] no scalar civilization balance path
- [] explicit selected-lens UI and evidence legend
- [] provisioning flow/project inspector
- [] civic participation/consent artifact
- [] extracted Moral Graph principle and classifier packs
- [] optional observations re-enter the solver with support refs
- [] no receipt or profile becomes terminal authority
- [] focused tests and Helix discipline pass
- [] browser screenshots verified when user server is available
